A VAR model describes the evolution of a set of k variables (called endogenous variables) over the same sample period ($t = 1, \dots, T$) as a linear function of only their past values. The variables are collected in a $k \times 1$ vector y_t , which has as the i th element, $y_{i,t}$, the observation at time “ t ” of the i th variable. For example, if the i th variable is GDP, then $y_{i,t}$ is the ...
